

Environmental policy

Environmental consideration – a matter of importance for Stenger & Ibsen

Stenger & Ibsen is proud to contribute to the work with the energy transition in Scandinavia by performing the Balance of Plant (BoP) for new wind farms. Our ambition is to offer resource-efficient solutions within the limitations of the individual project's specifications. In each project, we strive to offer solutions that lower the impact on the environment. In many cases this is done in an early stage of a project by an adaptive design based on many years of experience and in an open dialogue with our customers, suppliers, and other stakeholders.

As a company in the wind power industry, we have a special responsibility to contribute to sustainable development by:

- Integrating environmental responsibility into our core business and offer customers an environmentally sustainable design, construction, and logistics solution
- We work continuously with our subcontractors to improve their environmental responsibility and performance
- We comply with applicable laws and regulations where our operations are ongoing
- When we develop new services, processes, and products, we must ensure environmental consideration in a life-cycle perspective
- We must work preventively and if possible, avoiding the use of materials and methods that may have negative impact on the environment
- We must continuously reduce the use of fossil energy sources and find other methods that can contribute to limiting global warming
